baseline_available

1

Deltas are computed only when an audio-only baseline exists (baseline_available=1).

- Audio features (tempo, loudness) are the strongest similarity signals, though their importance shifts by genre.
- The audio-only model delivers stable Recall@10 and MRR@10 across most genres, providing a solid baseline.
- Adding lyrics has inconsistent effects: it boosts recall for some narrative/text-heavy genres (e.g., folk rock) but often hurts performance in audio-driven genres (hard rock, album rock, mellow gold), suggesting lyrics don't always match acoustic similarity.
- The evaluation uses Recall@10 and MRR@10 to compare audio-only vs. audio+lyrics similarity in a reproducible, interpretable way.
